Belgian Cancer Registry

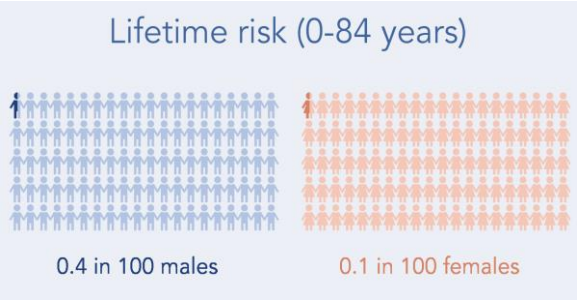
CANCER FACT SHEET 2024

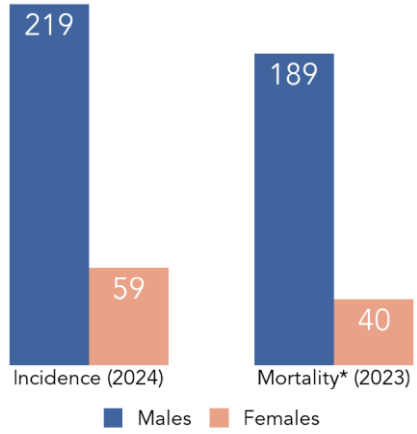
MESOTHELIOMA

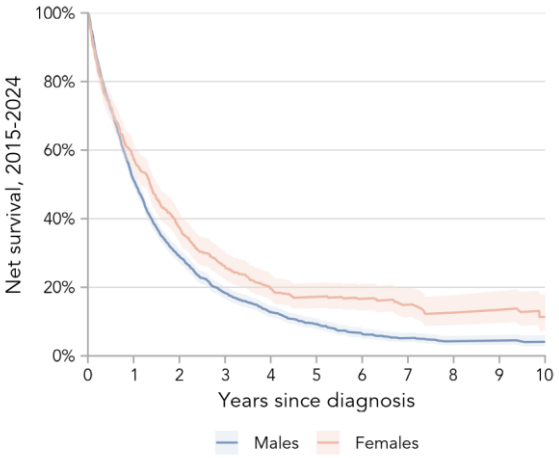
ICD-10 C45

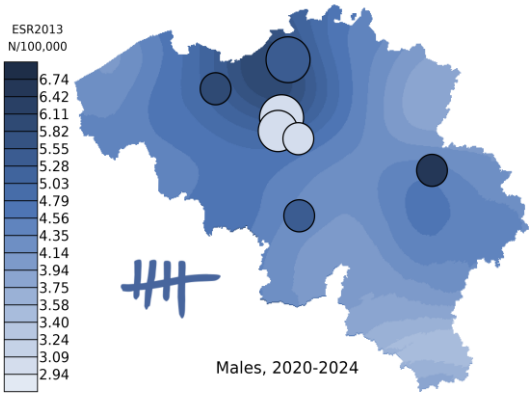
Key facts

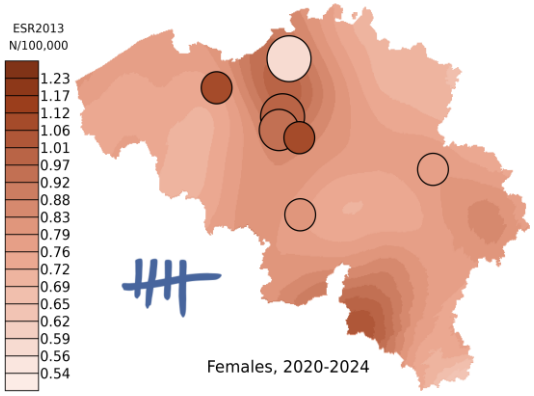
- **278** new diagnoses in 2024
- **54.7%** of the mesothelioma is diagnosed **in patients older than 75 years**
- **229** deaths due to mesothelioma in 2023
- 5-year net survival of **11.6%**







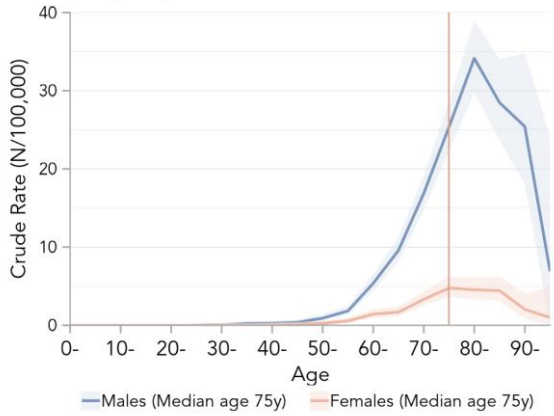




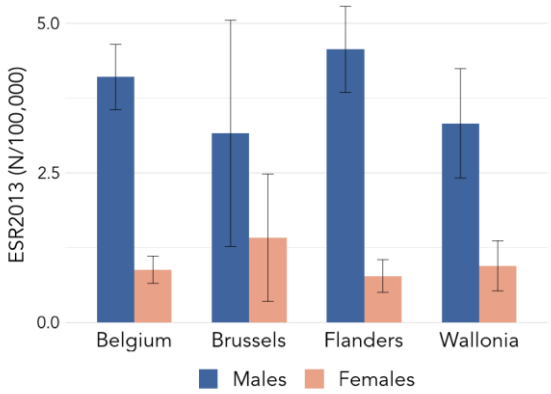
Belgian Cancer Registry

INCIDENCE

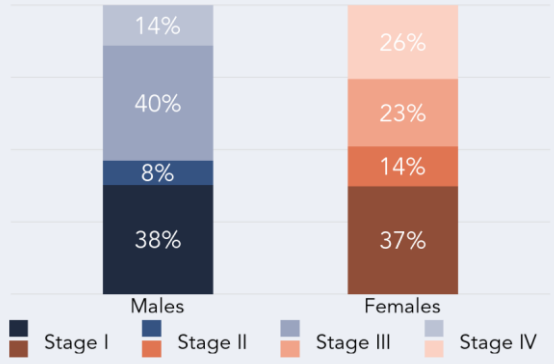
Age-specific incidence, 2020-2024



Incidence by region



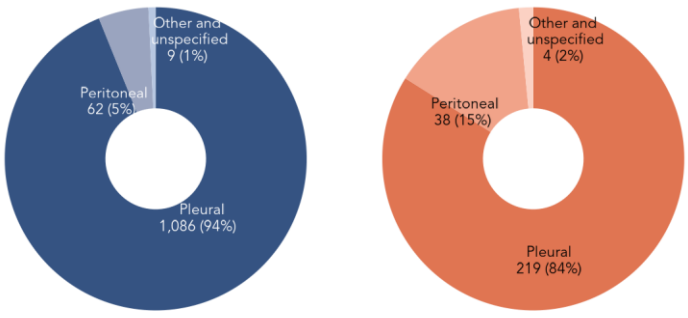
Stage distribution



Excluding unregistered stage (15.1%)

- Median age at diagnosis for mesothelioma is **76 years**, in 2024
- The majority of mesothelioma are diagnosed in a late stage **(stage III and IV)**
- The majority of mesothelioma cases are caused by **asbestos exposure**
- There is a higher risk of a mesothelioma diagnosis in Kapelle-op-den-Bos due to **historical asbestos processing**

Sublocation of mesothelioma, 2020-2024



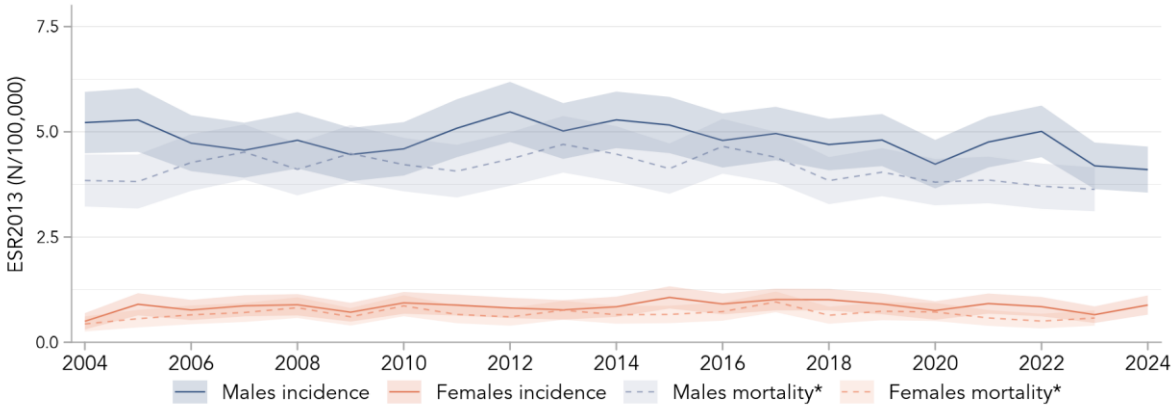
Males

Females

Belgian Cancer Registry

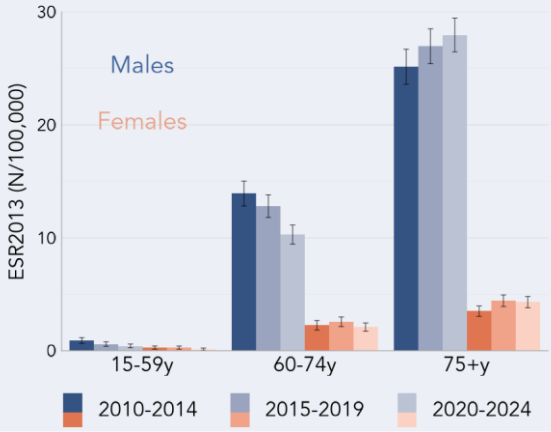
INCIDENCE TRENDS

Age-standardised incidence and mortality, 2004-2024

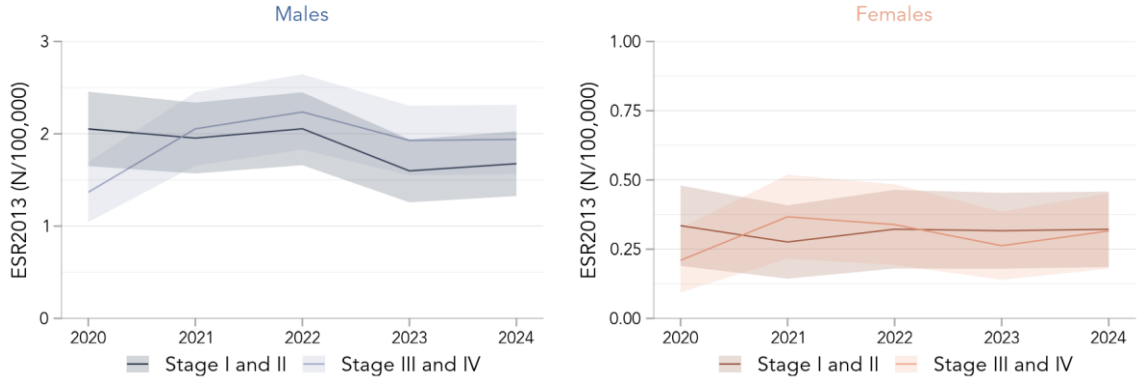


- Mesothelioma is a predominantly **male cancer**; male to female ratio of 3.7
- The average annual percentage change of the risk of a mesothelioma **diagnosis in males** is **−0.6%**, and of **mortality is −0.5%**
- The average annual percentage change of the risk of a mesothelioma **diagnosis in females** is **+0.4%**, and of **mortality is +0.3%**

Age-standardised incidence trends



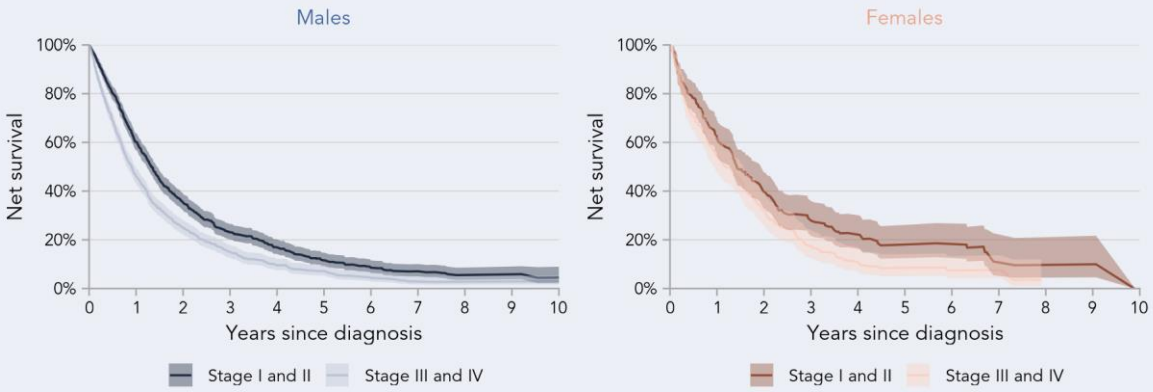
Incidence by stage



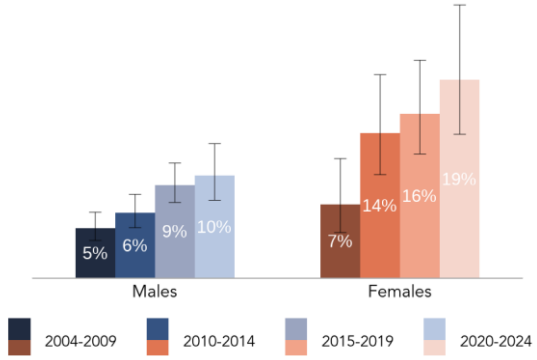
Belgian Cancer Registry

SURVIVAL

Net survival by stage, 2015-2024



5-year net survival over time



- **5-year net survival has been improving** for males and females in the last 21 years
- Regardless of stage, mesothelioma has a **poor prognosis**
- More than **500 people** are living with the consequences of mesothelioma

Additional detailed information (including prevalence) can be found in the **Appendix of the Cancer Fact Sheet** *and on the* **website of the Belgian Cancer Registry**

5-year net survival by sublocation and stage, 2015-2024, % (95% CI)				
	Males		Females	
Total	**9.3%**	**(7.9%; 10.9%)**	**17.1%**	**(13.8%; 21.2%)**
Sublocation				
Pleural	8.7%	(7.3%; 10.4%)	12.8%	(9.6%; 16.9%)
Peritoneal	17.3%	(11.0%; 27.2%)	36.7%	(27.1%; 49.8%)
Stage				
I	11.7%	(9.0%; 15.2%)	20.6%	(14.3%; 29.7%)
II	11.1%	(6.6%; 18.9%)	FU<5y	
III	8.5%	(6.0%; 12.1%)	11.0%	(6.2%; 19.4%)
IV	4.7%	(2.6%; 8.5%)	4.6%	(1.6%; 13.4%)
X/NA	8.9%	(6.4%; 12.5%)	26.0%	(19.4%; 34.8%)

Net survival can exceed 100%; more information in 'Concepts & Abbreviations' (last page)

CONCEPTS & ABBREVIATIONS

- **Absolute numbers (N):** The number of newly registered cancer diagnoses observed for a given period of time. All figures and numbers in this cancer fact sheet are based on diagnoses of Belgian residents.
- **Cancer maps:** Cities with at least 150,000 inhabitants are directly represented on the map as circles with a diameter relative to the population size, and a colour shading indicating the actual calculated ESR2013 in that city. The 19 municipalities of the Brussels Capital Region (more than 1,000,000 inhabitants) are divided in three separate circles, based on socio-economic parameters. The socio-economic status is lowest in the westernmost circle and highest in the easternmost circle. Methodological information is available in 'Cancer burden in Belgium 2004-2017, Belgian Cancer Registry, Brussels, 2020'.
- **Crude Rate (CR):** The crude rate is obtained by dividing the absolute number of diagnoses (N) by the corresponding population size at risk (N/100,000).
- **ESR2013:** Incidence rates standardised to the 2013 revised European Standard Population (ESP): Standardisation is necessary to accommodate for differences in population size and age distribution (over time or among regions). An important factor in interpreting trends in cancer incidence is population ageing, as cancer is an age-dependent disease. For a higher proportion of elderly people in the population, a higher total number of cancer diagnoses can be expected for the same cancer risk. When only absolute numbers (N) or Crude Rate (CR) results are used, a misleading picture of the actual changes in the risk of a cancer diagnosis could be obtained. Therefore, direct standardisation is necessary to evaluate the evolution of the risk of cancer diagnosis over time or among regions.
- **Net survival:** Often also called the relative survival, is an estimate of the survival probability when other causes of death beside the cancer type(s) under study are excluded. As examples of other causes of death, patients with the cancer type(s) under study could also die because of an accident or unrelated cardiac conditions, etc. Net survival may exceed 100%, this occurs when the observed survival probability for patients with the cancer type(s) under study is higher than the one for the matched general population (no excess mortality due to cancer).
- The net survival estimation was based on the regional lifetables 2024, obtained from Statbel.
- **Stage:** Cancers are reported with a stage, labelled with a Roman numeral with IV being the most advanced stage. Stage is based on the T-category (extent of the tumour), the N-category (absence or presence and extent of the regional lymph node metastasis) and the M-category (absence or presence of distant metastasis). Stage is reported as a combination of both clinical and pathological stage with priority given to the pathological stage. Clinical information about distant metastases (cM) will always be taken into account, and in case of neo-adjuvant therapy, priority is given to the clinical stage. If stage is unknown, not applicable or not submitted to the Belgian Cancer Registry, the stage is reported as 'unregistered stage'. Stage is reported according to the TNM 8th edition: J.D. Brierley, M.K. Gospodarowicz, Ch. Wittekind. TNM Classification of Malignant Tumours, 8th edition: UICC, 2017.
- **95% CI:** 95% Confidence Intervals are indicated with a shaded band or whiskers in the figures. The 95% CI is a range of values that has 95% chance to contain the true mean value.

**Mortality statistics in Belgium are collected and managed by the three Regions (Flemish Region: Departement Zorg; Brussels-Capital Region: Observatorium voor Gezondheid en Welzijn van Brussel-Hoofdstad/ l'Observatoire de la Santé et du Social de Bruxelles-Capitale; Walloon Region: Agence Wallonne de la Santé, de la Protection sociale, du Handicap et des Familles (AVIQ)). The Directorate General Statistics Belgium is responsible for collecting and merging the data coming from the regional agencies. Mortality data used in this cancer fact sheet are collected from the Directorate General Statistics Belgium and encompasses the period 2004-2023.*
